

★ Example of sliding window.

set : $x = \begin{bmatrix} [1, 2, 3, 4] \\ [5, 6, 7, 8] \\ [9, 10, 11, 12] \\ [13, 14, 15, 16] \end{bmatrix}$

kernel size $KH = KW = 2$ it selects a small 2×2 window each time.

How should I select the first ~~small~~ small window?

The ~~top-left~~ top-left corner of the window is at $(0,0)$

So select $x[0:0+2, 0:0+2] \xrightarrow{(0,0)}$ $x[0:2, 0:2]$
result is $\begin{bmatrix} [1, 2] \\ [5, 6] \end{bmatrix}$ $\xrightarrow{x[\text{row_start}:\text{row_end}, \text{col_start}:\text{col_end}]}$

move the window one step to the right

The top-left corner of second window becomes $(0,1)$
 $x[0:2+0, 1:2+1] \rightarrow x[0:2, 1:3] \rightarrow \begin{bmatrix} 2, 3 \\ 6, 7 \end{bmatrix}$

Continue to go right.

$$X[0:2, 2:4] \rightarrow \begin{bmatrix} 3 & 4 \\ 7 & 8 \end{bmatrix}$$

So there are 3 windows in the first line.
Now the window slides down one line. Now the top-left corner is at (1,0).

$$X[1:3, 0:2] \rightarrow \begin{bmatrix} 5 & 6 \\ 9 & 10 \end{bmatrix} \text{ continue } X[1:3, 1:3]$$

$$\rightarrow \begin{bmatrix} 6 & 7 \\ 10 & 11 \end{bmatrix} \text{ continue } X[1:3, 2:4] \quad \begin{bmatrix} 7 & 8 \\ 11 & 12 \end{bmatrix}$$

So how many windows in total?

$$H_{out} = \frac{H+2p - k_H}{S} + 1 = \frac{4+0-2}{1} + 1 = 3$$

padding = 0
kernel size 2x2
stride = 1

$$W_{out} = \frac{w+2p - k_w}{S} + 1 = \frac{4+0-2}{1} + 1 = 3$$

So there are 9 small windows in total, these correspond to the 9 locations in the output feature map.

AA don't include the right boundary.

$$e.p.: \begin{bmatrix} 2 & 4 \end{bmatrix} \rightarrow \begin{bmatrix} 2 & 3 \end{bmatrix} \checkmark$$

cin sum

$$\text{result} = \sum_{h=1}^H \sum_{w=1}^W \text{window}[h,w] * \text{kernel}[h,w]$$

e.p.: window = np.array([[

$$\begin{bmatrix} 1 & 2 \end{bmatrix},$$

$$\text{kernel} = \text{np.array}([[$$

$$\begin{bmatrix} 5 & 6 \end{bmatrix},$$

$$\begin{bmatrix} 1 & 0 \end{bmatrix},$$

$$\begin{bmatrix} 0 & 1 \end{bmatrix}$$

])

])

$$\text{result} = \text{NP. Sum}(\text{window} * \text{kernel})$$

$$= \begin{bmatrix} [1 \times 1, 2 \times 0] \\ [5 \times 0, 6 \times 1] \end{bmatrix} = \begin{bmatrix} 1, 0 \\ 0, 6 \end{bmatrix}$$

$$1 + 0 + 0 + 6 = 7$$

so finally output result = 7
